

# **Belgian Industrial and Commercial Energy Storage Peak-Valley Arbitrage Solution**

## Overview

---

What is Peak-Valley price arbitrage?

1. Peak-Valley Price Arbitrage Peak-valley electricity price differentials remain the core revenue driver for industrial energy storage systems. By charging during off-peak periods (low rates) and discharging during peak hours (high rates), businesses achieve direct cost savings. Key Considerations:.

What is a Bess optimization model for electricity price arbitrage and reserve ancillary services?

Taking the maximum annual net revenues of the BESS as the optimization objective, an optimization model of the BESS considering both electricity price arbitrage and reserve ancillary services is established. The annual net revenues of the BESS under different BESS capacities are evaluated.

How does Bess generate revenue from electricity price arbitrage and reserve service?

It generates revenue through electricity price arbitrage and reserve service. The BESS's optimization model and the charging-discharging operation control strategy are established to make maximum revenue. The simulation study is based on one-year data of wind speed, irradiance, and electricity price in Hangzhou City (Zhejiang Province, China).

What is the difference between Peak-Valley electricity price and flat electricity price?

Among the four groups of electricity prices, the peak electricity price and flat electricity price are gradually reduced, the valley electricity price is the same, and the peak-valley electricity price difference is 0.1203 \$/kWh, 0.1188 \$/kWh, 0.1173 \$/kWh and 0.1158 \$/kWh respectively. Table 5. Four groups of peak-valley electricity prices.
