

# **Different air intake methods for solar container battery boxes**

## Overview

---

Can a battery container fan improve air ventilation?

The existing thermal runaway and barrel effect of energy storage container with multiple battery packs have become a hot topic of research. This paper innovatively proposes an optimized system for the development of a healthy air ventilation by changing the working direction of the battery container fan to solve the above problems.

Can a battery energy storage system be used inside a building?

Using new or second-life Li-ion batteries (LIB) as energy storage is recognized as the most realistic solution to drive wider adoption and effective utilization of RES. However, the use of battery energy storage systems (BESS) inside buildings may bring significant potential risks, particularly in the case of fire.

How to optimize the air volume ratio of a battery pack?

Optimized solution 2: Set fans 1-3 and 8-10 to suction state. Fans 4-7 and 11-14 are set to blow state. The purpose of this strategy is to further optimize the air volume ratios of the battery packs within the chamber, thus forming a cycle of suctioning air from the top and blowing air from the bottom.

How does a battery room ventilation system work?

The battery room has a separate ventilation system, see Figure 7, Figure 8, and Figure 9. During normal operation, ventilation fans draw air from the ventilated parking garage to ensure sufficient air exchange in the battery compartment for cooling purpose. The fans are equipped with fire dampers connected to the fire alarm system.
