

Folding Container Single-Phase vs Diesel Engine

Overview

How to choose a power system for electric propulsion in a container ship?

Economic feasibility provides significant information for selecting technological alternatives. After the EEDI calculation, the result of economic analysis is the next consideration to choose an appropriate power system for electric propulsion in a large container ship.

How long does it take to fold a container?

Folding and unfolding of such containers take only ten minutes and four folded containers are connected or 'bundled' together to form a single unit. These bundled single units are then handled like a single container using normal MHE.

What is a medium sized Reefer?

Medium-sized reefers balance power consumption and cargo space. They're versatile for various shipping needs. Our 20ft refrigerated container is ideal for medium-sized loads. It provides 28.3m³ of space and can handle a payload of up to 27,360kg. Larger containers demand more power but provide maximum cargo capacity.

Do reefers use electricity or diesel?

Refrigerated containers mainly use electricity and diesel for power. Electricity is most common at docking and holding facilities. Diesel powers generators and serves as a backup solution. Modern reefers focus on energy efficiency, using advanced insulation and cooling technologies to minimise power consumption.
