

Grid-connected inverter can be used as off-grid

Overview

What does a grid connected inverter do?

Photovoltaic grid-connected inverters rely on the large power grid to operate. When the power grid is disconnected, the grid-connected inverter will be in an island protection state and stop working. Its main function is to convert solar energy into electrical energy and transmit it through the power grid.

What is an off-grid inverter?

Though fundamentally an off-grid inverter, this versatile model features grid input support—allowing it to draw power from the grid when solar and battery resources are insufficient. Commonly known as an off-grid hybrid inverter, it combines solar + battery + optional grid power, ensuring uninterrupted energy supply.

Can a grid tie inverter be used as an off-grid?

Sometimes, an on-grid inverter can be used directly as an off-grid inverter. The grid tie inverter sends energy directly to the grid, so the frequency and phase of the grid must be tracked. It is equivalent to a current source. Of course, there are also some inverters that have low-voltage ride-through capability and can be used for PQ adjustment.

What is a grid-tied inverter?

A grid-tied inverter solely designed for solar-to-grid applications, with no battery support. It provides efficient solar energy conversion and direct grid feed-in but cannot store energy. Ideal for locations with stable grid access and net metering policies, where users aim to offset electricity bills without investing in battery systems.
