

# High temperature air solar container energy storage system design

## Overview

---

Which container should be used for solar thermal applications?

Considering solar thermal applications around 100°C, the most appropriate container that could be used is the shell-and-tube. As shell-and-tube is commonly used in industries, many modifications are possible to suit the requirements of solar thermal systems.

What is compressed air energy storage (CAES)?

Compressed air energy storage (CAES) is an effective technology for mitigating the fluctuations associated with renewable energy sources. In this work, a hybrid cogeneration energy system that integrates CAES with high-temperature thermal energy storage and a supercritical CO<sub>2</sub> Brayton cycle is proposed for enhancing the overall system performance.

What is high-temperature energy storage?

In high-temperature TES, energy is stored at temperatures ranging from 100°C to above 500°C. High-temperature technologies can be used for short- or long-term storage, similar to low-temperature technologies, and they can also be categorised as sensible, latent and thermochemical storage of heat and cooling (Table 6.4).

Which heat storage material is selected?

The selected heat storage material is the S117 Phase Change Material that has a melting point at 117°C matches the operational temperature of the system at approximately 120°C.
