

Senegal High Temperature Solar System

Overview

Does Senegal have a solar energy sector?

Senegal's energy sector is increasingly reliant on solar power, making it essential to assess its long-term viability under changing climate conditions. This study evaluates future solar energy production in Senegal up to 2050, focusing on eight operational solar plants: Bokhol, Sakal, Malicounda, Kahone, Ten Merina, Mekhe, Ndiass, and Kael.

How does solar production affect climatic conditions in Senegal?

The seasonal cycle of solar production over Senegal (Ten Merina) is largely influenced by solar radiation, with peak production occurring in March-April and the lowest production during the rainy season (July-September). This demonstrates the dependence of solar production on climatic conditions.

Do solar power plants in Senegal vary over time?

They found that Senegal experiences significant variability in solar resources over time and across different locations, depending on the year and specific site conditions. Niang et al. (2023) evaluated the seasonal performance of six solar power plants in Senegal, namely Bokhol, Sakal, Malicounda, Kahone, Ten Merina, and Mekhe.

Is there a bias correction for solar energy production in Senegal?

Despite the higher resolution and detailed regional climate information provided by the CORDEX-CORE datasets, biases are noticed. These results suggest a bias correction to better estimate the future changes in solar energy production in Senegal. A bias correction is performed using the method described in Eq. 5 (Fig. 4b).
