

The role of RV solar power inverter

Overview

What is RV solar power system inverter?

An RV solar power system inverter is responsible for converting the 12V DC power generated from the RV solar panels to alternating current. The DC is constant, while the AC is destined to cycle from +120V to -120V and vice-versa.

How does an RV inverter work?

Your RV inverter runs larger appliances and power-hungry systems like the microwave or convection oven, a space heater, curling iron, electric blanket, or refrigerator. These all require more power than it's offering in a 12v system. So the inverter turns the 'one-way current' of DC power into a 'two-way current' of AC power.

Do you need an RV inverter?

RVers often have both for maximum flexibility. While it may not be flashy, an RV inverter offers some significant benefits, especially for certain camping styles. With an inverter, you can run your microwave, computer, and watch TV, all without shore power. With a large enough inverter even an air conditioner may run.

Are all RV inverters the same?

While all inverters generally do the same thing, there are some key technical differences that you should be aware of before purchasing an RV inverter. A modified sine wave inverter creates an ac waveform but it does not look like what you get from the power grid. It usually is a square or stepped wave that is called "modified"
