

Thickness of curtain wall solar glass

Overview

How thick is curtain wall glass?

The glass used in these systems can vary in thickness, depending on several factors, including the building's location, height, wind loads, and other environmental factors. In general, the thickness of the glass used in curtain wall systems ranges from 6mm to 19mm.

How does thickness affect curtain wall performance?

The thickness of the glass used in a curtain wall system can have a significant impact on its performance. Thicker glass provides better sound insulation, reduces the amount of heat lost through the glass, and is more resistant to breakage. Thicker glass also provides better security by making it harder to break into the building through the glass.

What is the minimum thickness of a curtain wall?

For example, in the United States, the IBC requires a minimum thickness of 6mm for glass used in curtain wall systems for buildings located in areas with wind speeds of up to 130 miles per hour. For buildings located in areas with higher wind speeds, the minimum thickness of the glass is increased.

What is a photovoltaic curtain wall?

Building Integrated Photovoltaics At Onyx Solar we provide tailor-made photovoltaic glass in terms of size, shape, transparency, and color for any curtain wall design. Photovoltaic curtain walls transform any building into a self-sufficient energy infrastructure and enhance the building's architectural design.
